PMO-Ops Command Center

Business & Operations Plan

Product Overview, Feature Set, Readiness Assessment, and Strategic Fit Analysis

---

Document Purpose: This plan outlines everything PMO-Ops does, how it is scored, how it compares to industry standards, and whether it is genuinely solving the right problem for the right people — in plain language, with no unnecessary complexity.

PART ONE: THE PROBLEM WE ARE SOLVING

Who Is Struggling — and Why

The people PMO-Ops is built for are operators — founders, project managers, operations directors, and small-to-mid-sized business owners who are responsible for making their organization actually work.

They share a common set of problems:

1. No single source of truth. Most businesses run on scattered tools — spreadsheets, email threads, different apps for different teams. Nobody has one clear place to see how the whole operation is performing. Decisions get made on gut feeling instead of real information.

2. Projects fall through the cracks. Work gets tracked in too many places (or not at all). Deadlines slip. It is unclear who owns what, who approved what, or why something is blocked.

3. Finance and operations live in separate worlds. Expenses, invoices, and budgets sit in accounting tools that nobody outside finance can read clearly. There is no connection between what is being spent and what the business is actually getting for it.

4. No structured guidance. Most small and mid-sized businesses do not have access to senior advisory help — a Chief Operating Officer, a Chief Financial Officer, or a strategy consultant. They are making critical decisions without frameworks, benchmarks, or expert input.

5. Meetings produce no output. Teams spend hours in meetings but rarely capture decisions, action items, or next steps in a consistent way. Institutional memory disappears when people leave.

6. No way to measure how healthy the business actually is. There are plenty of tools for tracking tasks. Almost none help a business owner understand whether their organization is becoming stronger over time — or quietly drifting.

What We Are Building

PMO-Ops is a command center — a single operating system for running a business. It replaces the chaos of 8–12 disconnected tools with one structured environment where leadership can see everything, act on priorities, and get guidance in real time.

Think of it as the business intelligence (data and reporting) system, the project management office (the team or process that keeps initiatives on track), the advisory board, and the finance dashboard — all in one place.

PART TWO: THE AUDIENCE

Who PMO-Ops Is For

Profile	Description
Solopreneurs and Freelancers	Individual operators who need structure without complexity. One workspace, clear dashboards, and guided frameworks to run their work professionally.
Small Team Founders	Founders with 2–15 employees who are growing and need to stop managing everything in their head. They need visibility, accountability, and better decisions.
Growth-Stage Business Owners	Companies with 15–50 people, multiple departments, and increasing complexity. They need cross-department visibility, financial tracking, and operational discipline.

Profile	Description
Operations Directors and PMO Leads	Professionals inside larger organizations who are responsible for keeping projects, people, and priorities aligned. They need powerful tooling that matches their level of sophistication.
Established SMBs	Businesses that have been operating for years but have never had a proper operational system. They are profitable but chaotic. PMO-Ops helps them formalize without over-engineering.

Is the Product Tailored to This Audience?

The honest answer is: mostly yes — with specific areas for improvement.

Where the product is well-targeted:

- The language inside the app is plain and direct. Advisory explanations avoid academic jargon and speak in practical terms ("helps you figure out why things aren't working and fix them for good").
- The tiered pricing model ($0 → $30 → $75 → $250 → enterprise) follows how businesses actually grow. You can start for free and expand as your needs grow, rather than paying for enterprise features you do not need yet.
- The scoring and readiness system gives operators a concrete, comparable number for how their business is performing — something most small businesses have never had before.
- The advisory section offers structured expert guidance that most small businesses cannot afford to hire full-time. Even on a Consultant (Tier 1) plan, users get 1 scheduled advisory session per month with structured context and a 24-hour response guarantee.
- The Note Taker is built for how real meetings work — record, transcribe, summarize, and produce action items automatically. This directly addresses the "meetings without output" problem.

Where there is room to strengthen alignment:

- The breadth of features is impressive, but first-time users may feel overwhelmed before they understand the value. A better-guided entry experience (personalized onboarding

based on business stage, team size, and primary pain point) would accelerate time-to-value.
- For solopreneurs and freelancers, several modules (Departments, Compliance, Agile, Integrations) may feel beyond their current needs. Tier-based module visibility — where the interface surfaces only what is relevant to your level — would improve the experience at the lower tiers.
- The CRM (client relationship management system) and Marketing module are present but may benefit from stronger integration with each other to close the loop between pipeline and revenue.

PART THREE: FULL FEATURE SET

Module 1 — Command Dashboard (Home)

What it does: The main control center. At a glance, shows the health of your organization — overall scores, active priorities, alerts that need attention, and recommendations for what to focus on right now.

Key elements:

- Organization Health Score (0–100 composite score across five dimensions — explained in detail in Part Four)
- Live alerts for blocked initiatives, overdue items, and department risks
- Smart recommendations: the system surfaces what is most urgent and why
- Configurable sections — users and administrators can reorder and show/hide panels
- Works in multiple modes: Standard, Creative (for content-focused operators), and Focus

---

Module 2 — Finance Hub

What it does: Tracks all money moving in and out of the business, with structure for budgets, invoices, and expense categories.

Key features:

- Expense tracking with categories, status, and vendor details
- Invoice management
- Budget allocation and variance tracking (seeing where you planned versus what you actually spent)
- Profit & Loss (P&L) visibility

- Cash flow templates
- Collaborator invite links for expense submissions (so team members can submit expenses without needing full access)

Who needs this: Any business owner who is currently tracking finances in a spreadsheet and has no real-time view of where money is going.

Module 3 — Projects & Initiatives

What it does: Keeps all active work organized — what is being built, who owns it, what stage it is in, and whether it is on track.

Key features:

- Initiative (large-scale multi-step project) tracking with owners, status, priority, and risk level
- Project-level breakdowns within each initiative
- Dependency mapping (showing which projects are blocked by other projects)
- Action item tracking, linked to specific projects and people
- Agile sprint management (a structured method for organizing short work cycles, common in software and operations teams)
- Decision logging — a record of what was decided, who decided it, and why

Why this matters: Most businesses lose institutional knowledge when people leave or when decisions are never documented. This module creates a living record of how the organization makes and executes decisions.

Module 4 — CRM (Client & Contact Management System)

What it does: Tracks relationships with clients, leads (potential clients), and contacts across the organization.

Key features:

- Contact and company profiles with full history
- Pipeline stages — from first contact to closed deal
- Notes and activity logging per contact
- Filtering, search, and segment views
- Industry and source tagging

Who needs this: Any business that manages client relationships and wants to replace a spreadsheet or disconnected contact database with something connected to the rest of their operations.

Module 5 — Advisory

What it does: Provides access to structured expert advisory support across nine business disciplines — without hiring a full-time executive.

Available advisors:

Advisor	Expertise	Tier Required
Strategy	Vision, competitive positioning, goal architecture	Consultant+
Operations	Process design, workflow efficiency, performance improvement	Consultant+
Project & Program Management (PMO)	Initiative governance, delivery systems, accountability	Consultant+
Administrative Systems	Standard operating procedures (step-by-step guides for recurring tasks), authority structures, policy	Consultant+
Process Improvement	Root cause analysis, continuous improvement, performance tracking	Consultant+
Finance	Financial modeling, budgeting, cash flow	Tier 2+
Marketing	Go-to-market strategy (plan for reaching customers), demand generation, brand	Tier 2+
Technology & IT	Tech stack decisions, system architecture, digital transformation	Tier 3+

Advisor	Expertise	Tier Required
Data & Analytics	Business intelligence, dashboard design, KPI (key performance indicator) frameworks	Tier 3+
Customer Support	Customer experience design, satisfaction measurement, retention	Tier 2+

Session structure:

- **Consultant (Tier 1):** 1 session per month, 30 minutes
- **Tier 2:** 3 sessions per month, 60 minutes each
- **Tier 3:** 5 sessions per month, 90 minutes each
- **Response time:** All advisors commit to a 24-hour response on submitted requests

Why this matters: Access to this quality of advisory support typically requires a fractional executive (a part-time C-level hire), a consulting engagement, or a high-priced retainer. PMO-Ops makes it accessible at a fraction of the cost.

Module 6 — Meetings & Note Taker

What it does: Records, transcribes, and automatically summarizes meeting conversations. Captures action items from every session so nothing falls through the cracks.

Key features:

- Live voice recording and real-time transcription (converting speech to text as it happens)
- Automatic meeting summary generation: key decisions, outcomes, and next steps
- Action item extraction — the system identifies tasks from the conversation
- Notes organized by date, tag, and participant
- Searchable meeting library

Free tier: 30 minutes of recording per session (unlimited sessions). Similar to how Otter.ai (a popular meeting notes app) works — free users can record meetings up to 30 minutes, with the full session visible in notes afterward.

Paid tiers: Unlimited session length.

Module 7 — Departments

What it does: Gives each functional area of the business (Sales, Marketing, Finance, Operations, HR, Technology, etc.) its own performance view — with scores, initiatives, and health indicators specific to that team.

Key features:

- Per-department health scores
- Department maturity ratings (how formalized and effective the team is — from Foundational to Optimized)
- Active initiative and risk counts per department
- Comparison view across departments
- Benchmark against industry averages (how your department compares to similar businesses in your sector)

Module 8 — Compliance Tracker

What it does: Tracks regulatory obligations, internal policy requirements, and audit readiness — ensuring the business knows what it is required to do and when.

Key features:

- Compliance item tracking with status, due dates, and owners
- Risk-flagged items surfaced for leadership attention
- Policy documentation storage
- Audit trail (a record of who reviewed and approved what, and when)

Module 9 — Team Management

What it does: Manages the people side of the business — who is in the organization, their roles, capacity, and workload.

Key features:

- Team member profiles with role and department
- Capacity tracking (how much of each person's time is committed versus available)
- Leadership bandwidth indicators (flags when key people are stretched too thin)

- Org chart view

Module 10 — Knowledge Base

What it does: A searchable internal library of documents, frameworks, and operating guides that the team can reference.

Key features:

- Framework library (200–300+ depending on tier — proven operational playbooks from global standards like Balanced Scorecard, CMMI, Lean, ISO, OKR frameworks)
- Internal document storage
- Searchable by topic, department, or keyword
- Linked to relevant modules (a compliance framework links to the Compliance Tracker; an OKR template links to Initiatives)

Module 11 — Diagnostics

What it does: An internal health-check that audits how well the organization is operating and surfaces specific findings with recommended fixes.

Key categories checked:

- Strategic alignment (are your projects actually connected to your goals?)
- Governance (are decisions being made with the right authority and documentation?)
- Initiative health (are your active projects likely to succeed?)
- Maturity progression (is each department getting better over time or stagnating?)
- Operational signals (are there warning signs in workload, risk, or execution patterns?)

Module 12 — Reports

What it does: Visual reporting on organizational health, maturity trends, and performance over time — with industry benchmarking included.

Key features:

- Health score trend over 12 months
- Maturity score over time per department

- Revenue trend (when financial data is connected)
- Industry benchmark comparison — your score versus the average for your sector
- Export capability

Module 13 — Integrations & Migration Hub

What it does: Connects PMO-Ops to the tools already in use — and helps import existing data from tools being replaced.

Integration types:

- CRM systems (client relationship management tools)
- Accounting platforms
- HR systems (human resources software)
- Project management tools (Asana, Trello, ClickUp, Jira, Notion, and more via CSV — comma-separated values, a universal data format)

MigrateHub (Migration Center): A structured guided process for moving data from an old tool into PMO-Ops — with step-by-step instructions, branded tool icons for recognition, and status tracking throughout the import.

Module 14 — Workflows

What it does: Automates recurring operational processes — so routine tasks do not require manual initiation every time.

Key features:

- Workflow templates for common business processes
- Trigger-based automation (an action in one module can automatically create a task, alert, or update in another)
- Workflow health tracking

Module 15 — Marketing (Growth Module)

What it does: Tracks marketing performance, campaign status, and growth metrics for teams managing customer acquisition.

Key features:

- Campaign tracking
- Channel performance (which marketing channels are producing results)
- Growth KPI dashboards
- Connected to Finance for cost-per-acquisition visibility

Module 16 — TechOps

What it does: Monitors technical system health — particularly for organizations that depend on digital infrastructure.

Key features:

- System health monitoring
- Scheduled sync and status updates
- Integration with operational workflows
- Alert escalation for technical risks

Module 17 — Admin & System Settings

What it does: Controls the configuration of the entire platform — user settings, branding, workspace preferences, theme and display options.

Key features:

- User profile and organization settings
- Theme and display controls (accent colors, density modes — compact versus spacious layout)
- Banner and walkthrough customization
- Mode management (Standard, Creative, Focus)
- Notification and alert preferences

Module 18 — Pricing & Tier Management

What it does: Manages the access level of the account — what features and advisors are available at each plan level.

Plan	Price	Who It Is For	Key Capabilities
Free	$0 (ad-supported)	Anyone starting out	Limited insights, basic dashboards, 10–20 operational frameworks, single workspace
Solo (Consultant)	$30/month	Solopreneurs, freelancers	Full insights, 50–100 frameworks, project dashboards, OKR tracking (goals-and-key-results system), up to 5 users, 1 advisory session/month
Growth	$75/month	Small teams, growth-stage founders	200–300 frameworks, full business dashboards, scenario modeling (what-if financial planning), financial templates, benchmarking, up to 15 users, 3 advisory sessions/month
Command	$250/month	Growing SMBs, established teams	Complete analysis, cross-department intelligence, stress testing, system integrations (connections to other business tools), up to 50 users, 5 advisory sessions/month
Enterprise	$1,500–$2,000/month	Large organizations	Custom decision engine, white-label modules (rebrandable), full API access (direct data connection),

Plan	Price	Who It Is For	Key Capabilities
			unlimited users, dedicated support

PART FOUR: READINESS REPORT & ORGANIZATIONAL RANKINGS

What the Readiness Report Measures

PMO-Ops calculates an **Organization Health Score** — a single number from 0 to 100 — that represents how well-structured, aligned, and capable your business is at operating effectively.

This is not a vanity metric. It is built on five internationally recognized frameworks used by global management consultants and Fortune 500 companies — applied in a way that is accessible to businesses of any size.

The Five Scoring Dimensions

Dimension	What It Measures	Weight
Execution Discipline	Whether your team consistently delivers on commitments — on time, on budget, to specification	25%
Strategic Alignment	Whether your day-to-day projects and activities actually connect to your top-level goals	25%
Operational Capacity	Whether your team has the bandwidth (available time and energy) to take on work without burning out	20%
Process Structure	Whether your business has clear, documented ways of	15%

Dimension	What It Measures	Weight
	doing recurring tasks — or whether it depends on individual memory	
Risk Management	Whether your organization is identifying and actively managing the things that could go wrong	15%

Maturity Levels (How Your Score Is Interpreted)

Every department in your organization receives a maturity rating. These ratings use a globally recognized standard called CMMI (Capability Maturity Model Integration — a framework developed by Carnegie Mellon University for assessing organizational effectiveness).

Maturity Level	Score Range	What It Means
Foundational	0–29	The team is operating reactively. Processes exist informally, in people's heads. Work gets done but not consistently.
Developing	30–49	Some structure is in place. There are basic processes, but they are not consistently followed or measured.
Structured	50–69	Clear processes exist and are mostly followed. The team is proactive rather than reactive, but improvement is inconsistent.
Managed	70–84	Processes are well-defined, measured, and actively managed. Results are predictable and the team can improve systematically.

Maturity Level	Score Range	What It Means
Optimized	85–100	The organization continuously improves. Processes are refined based on data, and best practices are embedded in daily operations.

Industry Rankings & Benchmark Scores

PMO-Ops compares your organization's health and maturity scores against the average for your industry. This gives leadership a clear answer to: "Are we performing above or below what is typical for a business like ours?"

Current industry average scores (global baseline average: 62–65):

Industry	Average Score	What Drives the Score
Technology & Software	71	High adoption of structured goal-setting (OKR) and disciplined sprint-based execution cycles
Pharmaceuticals	69	Strong process structure driven by regulatory requirements and clinical trial governance
Healthcare	68	Strong governance and compliance, moderated by operational complexity
Insurance	67	Strong risk management culture, but lower strategic agility
Manufacturing	66	Lean and process improvement discipline is strong; strategic alignment can lag

Industry	Average Score	What Drives the Score
Legal Services	65	Near average; lower scores in cross-functional governance
E-Commerce	64	High operational speed, but execution gaps appear as organizations scale
Logistics & Transportation	64	Strong capacity management; coordination across sites creates drag
Education & Training	61	Scores vary significantly based on funding model and administrative structure

---

What the Diagnostics Report Flags

The diagnostics engine runs a continuous audit of your organization and surfaces specific findings with recommendations. Common flags include:

- **Approval authority gaps:** Projects over a certain cost or risk level have no documented escalation process — meaning decisions are being made without the right oversight.
- **Maturity stagnation:** Departments that have shown no improvement for three or more consecutive quarters — an indicator that improvement is not being managed, only hoped for.
- **Overloaded capacity:** Teams running above 85% utilization (meaning less than 15% of their time is unallocated) — which is a reliable predictor of quality decline, missed deadlines, and burnout.
- **Misaligned initiatives:** Active projects that cannot be traced back to a stated organizational goal — meaning effort is being spent on things that do not actually advance the strategy.
- **Risk exposure:** Open risk items that have not been assigned an owner or a mitigation plan.

PART FIVE: STRATEGIC FIT ANALYSIS

Key Question: Is This Tailored to Our Audience and Does It Solve Their Problem in the Best Way Possible?

The Verdict

PMO-Ops is well-positioned and genuinely solves a real problem. The market gap it addresses — affordable, integrated operational intelligence for small and mid-sized organizations — is large, underserved, and growing. The current alternatives are either too expensive (enterprise platforms like Salesforce, ServiceNow, or SAP), too narrow (single-purpose tools like Asana, QuickBooks, or HubSpot), or too generic (spreadsheets and slide decks).

PMO-Ops is one of very few tools that attempts to unify project execution, financial visibility, advisory access, organizational scoring, and knowledge management in a single product accessible below $250/month.

Where the Product Wins Clearly

1. The advisory model is genuinely differentiated. Combining structured expert guidance with the rest of the operational system — so advisors see the same data the operator sees — is a significant advantage. No current competitor at this price point offers advisory sessions connected to live organizational data.

2. The scoring and readiness report fills a white space. Small and mid-sized businesses have no access to the kind of organizational health measurement that large companies get from consultants. Giving every business — even on a free plan — a health score that compares to industry benchmarks is uniquely valuable and a strong retention driver.

3. The tiered pricing matches the audience's growth journey. The Free → Solo → Growth → Command → Enterprise ladder allows a user to grow with the product rather than outgrow it. This is how successful SaaS (software as a service — cloud-based software) products build long-term customer relationships.

4. The depth of frameworks is a moat. 200–300+ operational frameworks (Balanced Scorecard, OKR, CMMI, Lean, ISO standards) curated and connected to the live data inside the platform is a significant knowledge asset that would take years to replicate. Competitors would need to build this from scratch.

Where to Sharpen the Focus

1. The onboarding experience needs to earn trust faster. New users need to reach their "aha moment" — the moment they see why this product is different — within the first 5–10 minutes. A personalized setup flow (three questions: What is your biggest pain point? How large is your team? What is your current stage?) would route users to the one or two modules that matter most to them immediately.

2. Module overload for lower-tier users is a risk. A solopreneur on the Solo plan has no use for the Agile sprint module, the Compliance Tracker, or TechOps. Surfacing only the modules relevant to their tier and stage would reduce cognitive load and accelerate value.

3. The connection between modules needs to be made more visible. The platform's real power is in the integration — an expense approved in Finance flows into a project budget in Initiatives, which affects the department health score, which surfaces in the advisory context. Making these connections visible to users ("This expense contributed to a 4-point drop in your Finance department score — here's what to fix") would dramatically increase perceived value.

4. The free tier experience needs a clearer upgrade path. The free plan should deliver enough value to be genuinely useful — not so limited that it is frustrating. The goal of the free tier is to create believers. A user who sees their first health score, understands what it means, and gets one actionable recommendation is far more likely to upgrade than one who hits a paywall immediately.

PART SIX: SUMMARY OF RECOMMENDATIONS

Priority	Recommendation	Impact
High	Build a personalized onboarding flow (3-question setup) that routes users to their highest-value module immediately	Reduces time-to-value; increases free-to-paid conversion
High	Create "tier-aware" module visibility — hide or grey out modules not relevant to the user's plan and stage	Reduces overwhelm; improves product clarity

Priority	Recommendation	Impact
High	Add "connection callouts" that explain how actions in one module affect scores in another	Increases perceived intelligence; deepens engagement
Medium	Strengthen CRM ↔ Marketing module integration to close the pipeline-to-revenue loop	Serves growth-stage founders and sales-led businesses better
Medium	Develop industry-specific entry paths (e.g., "Are you a consulting firm? A manufacturing business?") to pre-configure the workspace	Makes the product feel purpose-built rather than generic
Low	Add a lightweight mobile-first summary view (a simplified dashboard for checking status on a phone)	Increases daily engagement habit; serves operators who are frequently away from their desk

---

CLOSING STATEMENT

PMO-Ops addresses a real, large, and growing need: small and mid-sized organizations are running without the operational infrastructure that gives larger organizations their competitive advantage. They cannot afford full-time Chief Operating Officers, dedicated strategy consultants, or enterprise software licenses. PMO-Ops bridges this gap at an accessible price point, with genuine depth and a scoring system that makes organizational performance visible and actionable for the first time.

The product is well-built and well-positioned. The opportunity ahead is in making the onboarding experience as intelligent as the platform itself — meeting each user exactly where they are, surfacing the right module at the right moment, and demonstrating value before asking for a commitment.

The audience fit is strong. The problem is real. The execution now needs to match the ambition of the vision.

PMO-Ops Command Center — Business & Operations Plan Prepared: March 2026 Version 1.0 — Internal Review Document
